

MOUNTING INSTRUCTIONS

3D - LIFTING SYSTEMS | IPK PLATES

ATTACHMENT OF THE SLOT - ANCHORS IN CONCRETE

There must be a cavity in the concrete in order to link the TH2 lifting clutch to the T-slot anchor. This cavity is spherical in shape and can be either a half ball or a small ball slot. Various support kits are available for making this recess. For a half ball cavity, the TH2 lifting clutch can be attached in any direction and can ultimately turn in the cavity during lifting until the lifting hook has reached its proper position. The RB recess former is the most practical.

RECESS FORMERS

The anchors are fitted in the mould with a recess former. The cavity former, enables the lifting clutch to fit over the anchor. Because of the special design, there are no sharp edges on the precast element. The recess formers are of course available in the same range as the lifting clutches and the anchors. This is indicated by a load group, marked on the top.

The formers are mounted on the mould with fixing plates. After demoulding the element, the recess formers can be removed easily. Another option is represented by the magnetic and steel recess formers.

The standard recess formers are made of rubber shore 65° - 70°. The rubber used has a good resistance to demould oil. The formers will keep their original shape, even when they are heated up to 120°C. They can be used many times. The steel magnetic recess formers are manufactured without rubber.

TKA-TILT ANCHOR

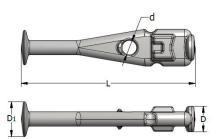

Forged from carbon steel, these have a design load capacity in the range of 13 kN to 50 kN.

TKA anchors can carry loads of between 13 kN and 50 kN. These anchors are used for tilting and transporting thin concrete walls. This type of anchor is typically used in combination with additional reinforcing steel. The TKA anchor must be fixed in the mould using a specific recess former RBK. The recess former holds the anchor securely in position when pouring the concrete. The IPK is mounted in the RBK in order to stabilise the RBK during pouring and hardening.

TKA anchors are available in two versions: shot blasting and hot-dip galvanising (TV).

Remark: this anchor does not allow for the lifting shackle to be turned or twisted inside the recess, using a spreader beam is recommended in combination with this anchor.

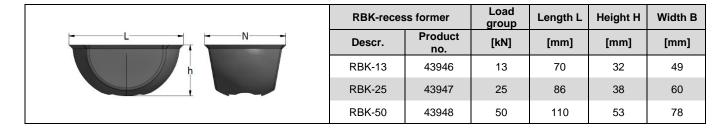

TKA-anchor black		TKA-anchor hot dip galvanised		Load group	L	Ø D	Ø D ₁	Ø d
Descr.	Product no.	Descr.	Product no.	[kN]	[mm]	[mm]	[mm]	[mm]

CHARACTERISTICS OF RBK BALLS

CHARACTERISTICS OF IPK PLATES

The IPK - plate is mounted in the RBK in order to stabilize the RBK during pouring and hardening.

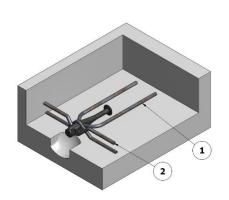

For tilting, additional reinforcements have to be installed in the anchor zone. Take care with anchor placement so that the anchors ensure the load transfer. The RBK recess former is removed from the hardened concrete, and then the lifting device can be connected. The shackle nose must be oriented in the direction of lifting.

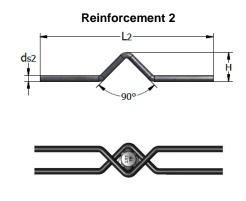

REINFORCEMENT USED IN ANCHOR ZONE FOR ANGLED LIFT IN PANELS OR BEAMS

Additional reinforcements:

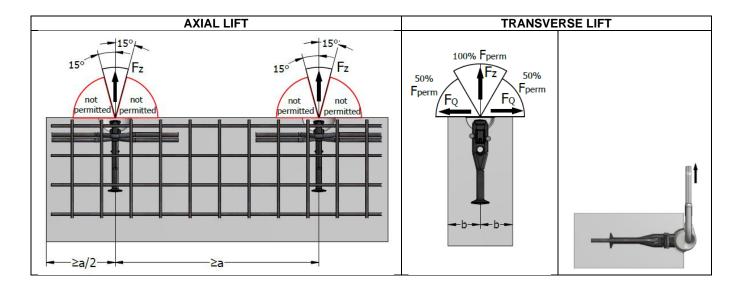

TKA-ANCHOR - LOAD CAPACITY AND REINFORCEMENTS							
TKA-anchor type	Load group	Mesh reinforcement		Reinforcement 1	Reinforcement 2		
			ds ₁	L (straight)	L/2 (bent)	ds ₂	L ₂

A spreader beam must be used when tilting precast elements with $\beta > 15^{\circ}$

The tilting anchor TKA is permitted only for axial or transverse loading. Diagonal pull with $\beta > 15^{\circ}$ is not permitted

CONTACT

TERWA is the global supplier for precast and construction solutions with multiple offices around the world. With all our staff, partners and agents, we are happy to provide all construction and precast companies who work in the building industry with full service and 100% support.
