GENERAL INFORMATION

PRODUCT DESCRIPTION

TERWA starter boxes are composed of the longitudinal steel profiles (rails) made by perforated, galvanized steel plate. Ribbed reinforcing bars are embedded in the profiles. Reinforcing bars from one side of the profile form anchoring loops, and from the other side- are bent to it and covered by the thick plastic tape. Concrete reinforcement bended starter boxes are used to perform vertical and horizontal connections of the elements of reinforced concrete constructions, concreted in stages and the precast elements with monolithic. Use of connecting set TERWA ensures fulfilment all requirements specified by standards for proper form of contact anastomosis. Standards for design concrete constructions assume that with the correct shape of the joint we can treat the construction element as homogeneous and permanently compound.

USE

Reinforcement bended Starter Boxes allow execution of connection reinforced concrete structural elements, concreted in various stages of construction, i.e. in connection of the walls, floors to walls, staircase landings, balconies, consoles etc. It allows significantly reduce the duration of the investment and reducing the period of lease elements of formwork system.

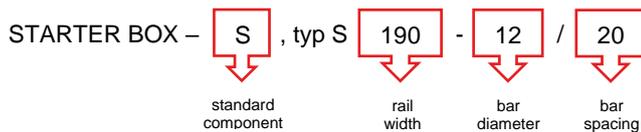

ADVANTAGES

- Simplified execution of constructing joins and additional concreting
- Easy and fast assembly - the component is attached to the formwork by nails
- Specially contoured shape of the perforated rail provides proper preparation of the contact surface on the connection of the two elements, implemented at different time
- Thanks to deliberately roughened joint with optimally shaped furrow (notch) entirely transfer shearing forces occurring in the connector
- It allows for continuity of reinforcement and required length of anchoring bars in elements of reinforcement concrete
- The shape of the rail guarantees the correct depth of concrete coverage of the reinforcing bars
- The rail is made from galvanized steel plate, what protects it by aggressive influence of environment at the storage stage and during realization
- The shape and construction of the rail provides stability during concreting and protect by permeation of the concrete inside the profile
- Thick plastic tape ensures durable protection of reinforcement bars at the time of installation the rail to the formwork. Perforation cut in the rail allows for its quick removal and commencement of reinforce works
- Possibility of matching to the different shapes of formwork (i.e. arch formworks)
- It can be adapted to different systems of reinforcement in elements of reinforced concrete-non-standard elements, on inquiry
- Reinforcement bended Starter Boxes have technical approval which can be asked for at TERWA Construction Group

TECHNICAL DETAILS

- Component length: 1,25 m
- Rail width: 60, 80, 110, 140, 160, 190, 220, 240 mm
- Reinforcement bar diameter: ϕ 8, 10, 12, 14, 16
- Rail bar spacing: 10, 15, 20, 25, 30
- Bending diameter: $6 \times \phi$ (bar diameter)
- Rail recess depth: 30 mm
- Reinforcement bars:
 - Yield strength $R_e \geq 500 \text{MPa}$
 - Tensile strength $R_m \geq 550$

Designation examples:

Additionally, construction of the TERWA Starter Boxes gives possibility of performance non-standard elements:

- In non-standard length
- By spacing bars other than standard
- With bigger thickness of the rail (more than 30 mm)
- With the other shape of anchoring loops
- With other bending diameters
- For wider joints there is the possibility of performing double-line connections (comprising two parallel rails)
- The bars Starter Boxes can be made with diameter 14,16 on inquiry

This solution it's shown in the Technical Approval published by ITB in Warsaw

THE ANCHORAGE LENGTH AND OVERLAPPING THE BARS ACCORDING TO PN-EN 1991-1-1

BASIC ANCHOR LENGTH $l_{B,RQD}$ WG PN-EN 1992-1-1

When calculating the required anchor length, one should consider the steel grade and those properties of bars that influence adhesiveness.

$$l_{B,RQD} = \frac{\phi}{4} \frac{\sigma_{sd}}{f_{bd}}$$

- σ_{sd} - calculational tensile stress at the spot from which the anchor length is measured
 f_{bd} - calculational value of concrete tensile strength
 ϕ - bar diameter

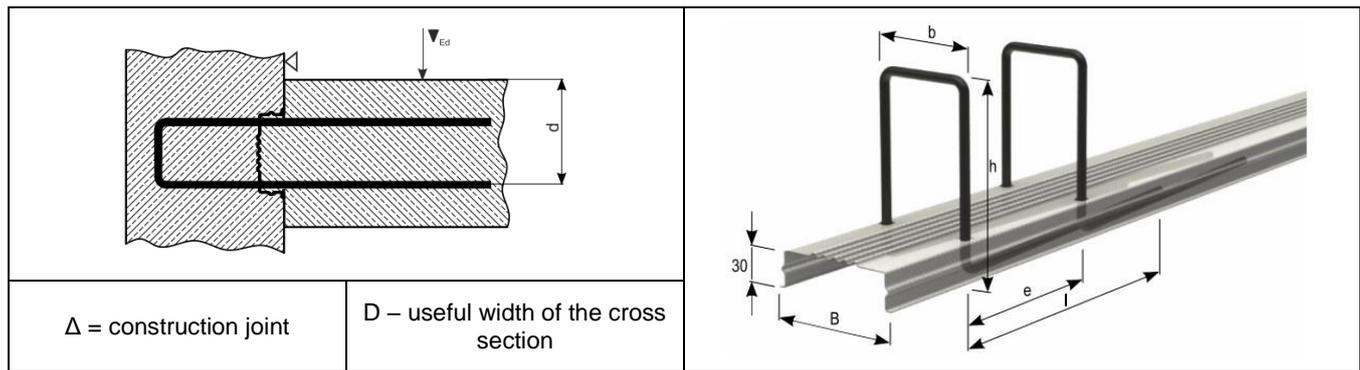

OVERLAP LENGTH l_0 WG PN-EN 1992-1-1

The calculation overlap length is:

$$l_0 = a_1 \cdot a_2 \cdot a_3 \cdot a_5 \cdot a_6 \cdot l_{b,rqd} \quad \text{but not less than } l_{0,min}$$

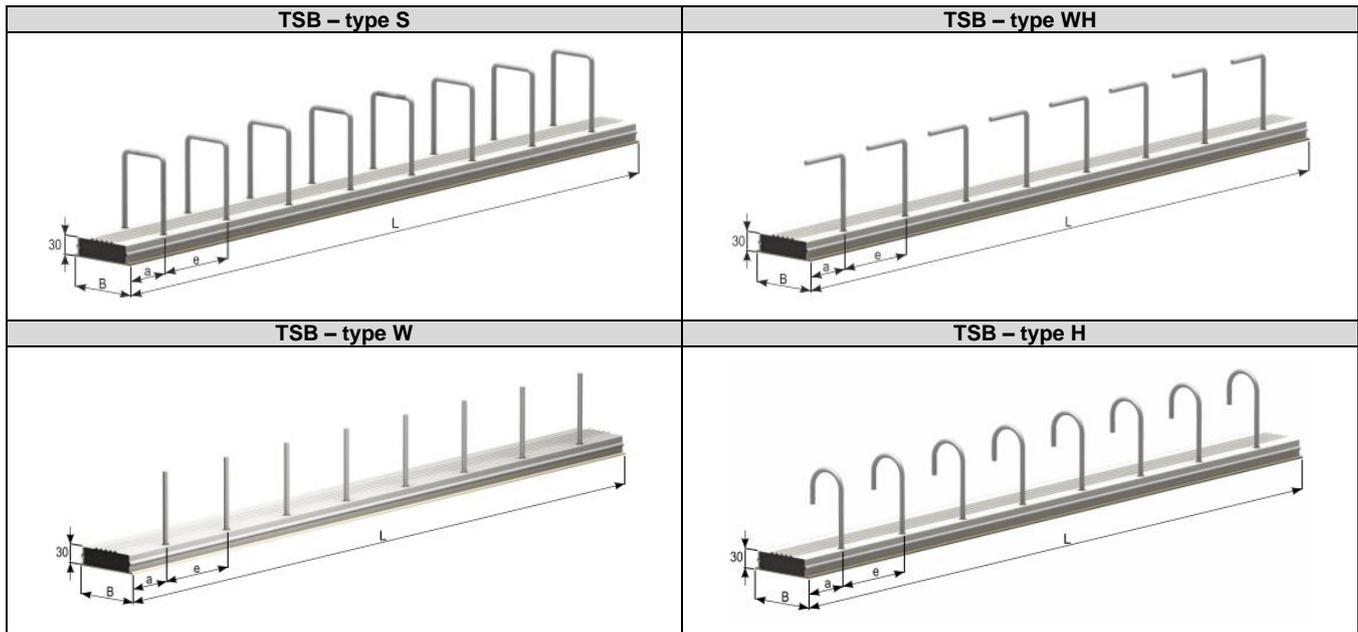

- l - basic anchor length
 a_1, a_2, a_3, a_5, a_6 -coefficient values according to table 8.2 of the standard
 $l_{0,min} = \{0,3 \cdot a_6 \cdot l_{b,rqd}; 15\phi; 200\text{mm}\}$

NON-STANDARD COMPONENTS

	<p>TERWA Starter Box reinforcement system in the non-standard versions:</p> <p>Component length - 1,25 m; other lengths upon request</p> <ul style="list-style-type: none"> • Rail width: 60, 80, 110, 140, 160, 190, 220, 240 mm • Reinforcement bar diameter: 8, 10, 12, 14, 16 mm • Rail bar spacing: 10, 15, 20, 25, 30 cm; other spacing distances available upon request • Loop width must be lower than the width of the reinforced component by at least 2 cm • Possibility of increasing thickness of the rail allows performance cavity bigger than 30 mm
<p>Fig. BINDAX type B. Broad joint using two rails</p>	<p>Designation examples:</p> <p>STARTER BOX – N, typ KO 160 - 10 / 20</p> <p style="text-align: center;"> Non-standard components rail width bar diameter bar spacing </p> <p>H= 15cm, b= 14cm, l= 48cm</p>

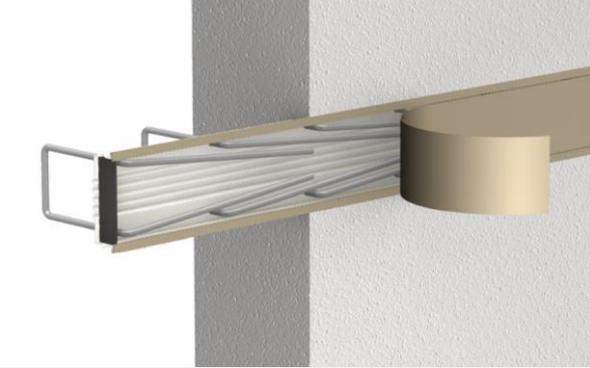

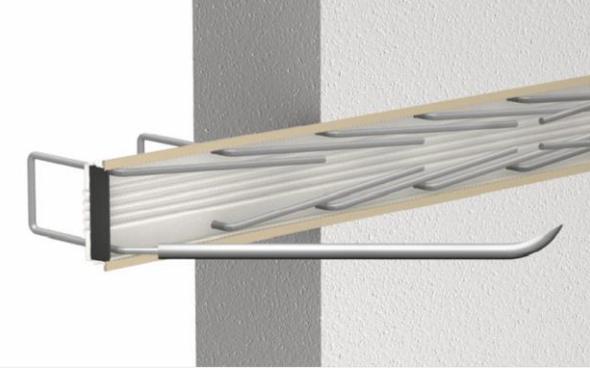

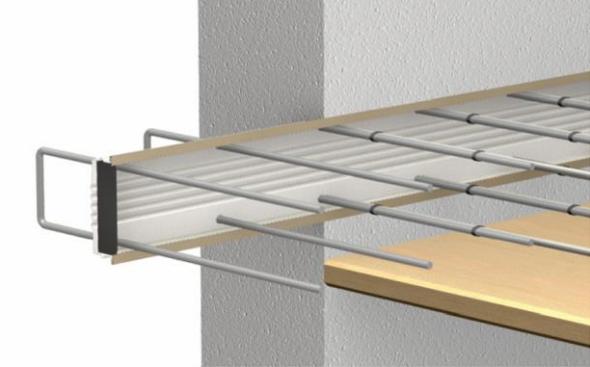

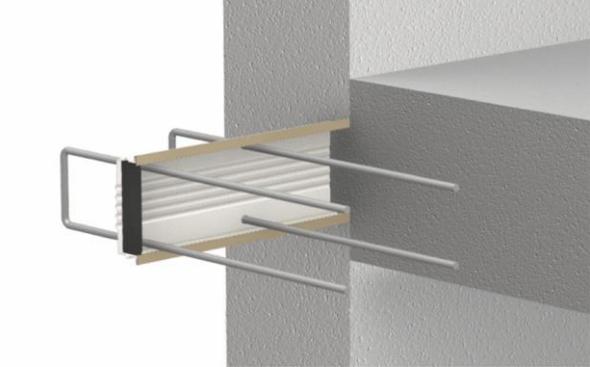

NON-STANDARD BAR TYPES

<p>Type W: Single bar, perpendicular to the rail</p>	
	
<p>Type WH: Single bar bent by 90°. Bends placed along rail</p>	
	
<p>Type WS: Single bar bent by 90°</p>	
	

Type H: As in the standard version. Bends placed crosswise with respect rail. Width - 60 or 80 mm. Single-row variant

Type BK: Symmetric 'console'-type loop. Closed loop. Available versions for the following loop spacings: 90, 120, 140, 170, 200, 220mm.

Type BA: Arch allowing deep anchoring

Type S: Symmetric loop

Type KO: Symmetric 'console'-type loop. Open loop

Type K: Closed loop. Minimal size b=90 mm

Type KH: Semi-open loop	
 <p>Diagram showing the cross-section of a semi-open loop. Dimensions include: h (loop height), l (loop length), b_1 (left rail width), b_2 (right rail width), and h_1 (left rail height).</p>	 <p>3D perspective view of the semi-open loop installed on two parallel rails. Dimensions include: b (loop width), h (loop height), $30(50)$ (rail height), B (rail width), and e (loop offset).</p>
Type B: Symmetric loop installed in two parallel rails	
 <p>Diagram showing the cross-section of a symmetric loop. Dimensions include: h (loop height), l (loop length), and b (loop width).</p>	 <p>3D perspective view of the symmetric loop installed in two parallel rails. Dimensions include: b (loop width), h (loop height), $30(50)$ (rail height), B (rail width), and e (loop offset).</p>
Type BA+H: Arch with single or dual rail	
 <p>Diagram showing the cross-section of an arch. Dimensions include: h (arch height), l (arch length), b_1 (left rail width), b_2 (right rail width), h_1 (left rail height), and h_2 (right rail height).</p>	 <p>3D perspective view of the arch installed on a single or dual rail. Dimensions include: b (arch width), h (arch height), h_1 (left rail height), h_2 (right rail height), $30(50)$ (rail height), B (rail width), and e (loop offset).</p>

ASSEMBLY INSTRUCTIONS

1. Nailing the starter box rail to the formwork	2. Concreting the element
	
3. After removal of the formwork from the concreted component, tear away the protective film along the incisions	4. Bend away bars using the special pipe-shaped bending component or the grip ferrule. Avoid having to bend bars again
	
5. The bendable bars are ready for joining with further reinforcement bars	6. View of joints of two elements
	

Additional remarks

- Before concreting the TERWA Starter Box bendable reinforcement bar system, the location of the component rebar needs to be inspected so as to maintain the required anchor lengths and bar overlay values. The 'h' dimension, or the section anchored in the first stage is calculated from the formwork face.
- Welding the bars in the bending area can negatively influence the properties of the steel, hence, it should be avoided. In the other sections, it should be executed at the responsibility of the contractor.
- The TERWA Starter Box reinforcement bar load bearing capacity is lower by approx. 20% due to bending to fit the profiles and then bending away. Hence, reinforcement bars should be bent only once. Do not carry out bending in an ambient temperature below 15°C.

CONTACT

TERWA is the global supplier for precast and construction solutions with multiple offices around the world. With all our staff, partners and agents, we are happy to provide all construction and precast companies who work in the building industry with full service and 100% support.
